

Amendments To The Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A Venetian blind cutting machine comprising:

a machine base;

at least two molds disposed at said machine base at different height levels; each of said molds having at least

one receiving hole for receiving raw material therein;

at least ~~one cutter~~ two cutters, each of said cutters being slidably disposed at one side of said molds; the traveling distance of said cutter ~~can cross~~ crossing said receiving holes of said molds;

a cutter driving assembly disposed at said machine base for driving said cutter to travel, and

a work table disposed at one side of said machine base, which has seats thereon corresponding to said molds respectively for putting the raw material ~~materials~~ thereon.

2. (Currently Amended) The Venetian blind cutting machine as defined in claim 1, wherein said machine base has a seat plank, which has windows thereon; each of said molds

01 15  
having a main board secured at one side of said seat plank;  
each of said main boards having a top-rail receiving hole and  
a transverse guiding slot; a transverse sliding block slidably  
engaging to said transverse guiding slot, which has a bottom-  
rail receiving hole thereon; a slat receiving hole formed in  
between said transverse sliding block and said transverse  
guiding slot; said receiving holes being behind said windows  
of said seat plank; further comprising a mold stopping  
assembly, which has a stopping shaft seat disposed at said  
seat plank corresponding to the exterior side of said  
transverse guiding slot; said stopping shaft seat having at  
least two transverse through holes thereon respectively  
corresponding to said transverse guiding slots; at least two  
stopping shafts respectively passing through said transverse  
through holes and receiving in said transverse guiding slots  
and being connected to said transverse sliding block; a  
connecting block disposed at the exterior ends of said  
stopping shafts; a screw shaft seat disposed at said stopping  
shaft seat at the side of opposite from said molds; said screw  
shaft seat having a transverse thread hole; a screw shaft  
meshed mesh with said transverse thread hole at ~~for~~ the  
interior end thereof can be ~~against~~ connected to said  
connecting block for driving said stopping shaft to move.

3. (Original) The Venetian blind cutting machine as defined in claim 1, wherein said top mold has a vertical guiding slot thereon; a vertical sliding block slidably engaging to said vertical guiding slot; a screw shaft passing through said mold from the top end of said mold to the bottom end of said mold; the bottom end of said screw shaft being against said vertical sliding block for driving said vertical sliding block to move.

25  
a | 4. (Currently Amended) The Venetian blind cutting machine as defined in claim 1, wherein said cutter locates at front sides of said molds respectively; said cutter driving assembly can drive said cutters to travel together.

5. (Original) The Venetian blind cutting machine as defined in claim 4, wherein each of said molds has two transverse guiding rails at topside and bottom side thereof respectively; each of said cutters having two sliding pieces at topside and bottom side thereof slidably engaging to said guiding rails respectively.

6. (Currently Amended) The Venetian blind cutting machine as defined in claim 1, wherein said cutter driving assembly comprises an AC motor, a gear train disposed at the output shaft of said AC motor for decreasing the output speed

of said AC motor; a shifting block slidably disposed on said machine base for sliding in transverse direction, which has a rack thereon for meshing with an output gear of said gear train; ~~each of said cutters connecting to said shifting block respectively by a connecting bar~~ two connecting bars having opposite ends thereof secured at said shifting block and said two cutters.

9 7. (Original) The Venetian blind cutting machine as defined in claim 6, wherein said cutter driving assembly further comprises a DC motor disposed beside said AC motor; a belt providing on the output shafts of said AC motor and said DC motor.

8. (Original) The Venetian blind cutting machine as defined in claim 1 further comprising a blind stopping assembly, which comprises a frame disposed at said machine base beside said molds; at least one guiding bar disposed at said frame; at least one sliding block slidably engaging to said guiding bar, which has a holding segment thereon for user to grip and a stopping board against the front ends of the raw materials; at least one spring disposed on said guiding bar for pushing said sliding block in the direction of away said molds.

9. (Original) The Venetian blind cutting machine as defined in claim 8, wherein the amount of said sliding blocks are equal to said molds and positioning at different height levels of corresponding to said molds respectively.

10. (Original) The Venetian blind cutting machine as defined in claim 1, wherein said work table comprises an elongated flat table, a front supporting table and a back supporting table; one end of said elongated flat table being closing to said molds; said elongated flat table having two guiding bars thereon; said front supporting table having a base seat disposed at the topside of said elongated flat table and engaging to said guiding bars for free sliding; a rotating seat having one end of the bottom side thereof pivoting with said base seat to be turned inward to cover said base seat and to be turned outward; said back supporting table disposed beside the front supporting table at the side of opposite from said molds, which comprises a locking seat slidably engaging to one of said guiding bars of said elongated flat table, and a rotating seat having one end thereof engaging to the other one of said guiding bars, such that said can be turned inward to against the top end of said locking seat and can be turned outward; a lower stopping board having one end thereof disposed at the bottom side of said rotating seat; an upper stopping board having one end thereof disposed at the top side

of said rotating seat; a horizontal board slidably engaging to said upper stopping board for free shifting in transverse direction.

*Cancelled J.P. 4-23-04 (See pg 23 lines 5-6)*

11. ~~(Original)~~ The Venetian blind cutting machine as defined in claim 10, wherein said elongated flat table is provided with a length scale thereon for reading the length of the raw material.
